

Question 4

Two players flip a fair coin alternately. The game ends when one gets heads

1.

Let head and tail denote the head and tail flip outcome respectively, then we have the probability space:

$$\Omega = \{\text{head}, \text{tail}\}$$

$$\mathcal{F} = \mathcal{P}(\Omega)$$

$$\mathbb{P} : \mathbb{P}(\{\text{head}\}) = \mathbb{P}(\{\text{tail}\}) = \frac{1}{2}$$

Let $T_i \subset \mathcal{F}$ be the i -th flip outcome:

$$T_i = \{\text{tail}\}, \quad i \in \{1, 2, \dots, n-1\}$$

And let $H_n \subset \mathcal{F}$ be the n -th flip outcome

$$H_n = \{\text{head}\}$$

Then we have:

$$\begin{aligned} \mathbb{P}_{T_1 \cap T_2 \cap \dots \cap T_{n-1}}(H_n) &= \mathbb{P}_{T_1 \cap T_2 \cap \dots \cap T_{n-2}}(T_{n-1})\mathbb{P}(H_n) \\ &= \mathbb{P}_{T_1 \cap T_2 \cap \dots \cap T_{n-3}}(T_{n-2})\mathbb{P}(T_{n-1})\mathbb{P}(H_n) \\ &= \dots \\ &= \mathbb{P}(T_1)\mathbb{P}(T_2)\dots\mathbb{P}(T_{n-1})\mathbb{P}(H_n) \\ &= \frac{1}{2^n} \end{aligned}$$

Answer

- $\mathbb{P}_{T_1 \cap T_2 \cap \dots \cap T_{n-1}}(H_n) = \frac{1}{2^n}$
