

Question 1

Consider a binary communication channel, with input X having a Bernoulli distribution with parameter $p = 0.9$. The common error probability is $\epsilon = 0.05$ (i.e., the probability that the received character differs from the input character is ϵ). Let Y denote the output character.

Part 1: Show that Y is a Bernoulli distribution with parameter q .

Solution

We know that X has a Bernoulli distribution in sample space $\Omega = \{0, 1\}$ (let 0 denotes *not received* and 1 denotes *received*) with parameter $p = 0.9$, then easy to see that

$$\begin{aligned}\mathbb{P}(Y = 1) &= \mathbb{P}(X = 0)\mathbb{P}_{X=0}(Y = 1) + \mathbb{P}(X = 1)\mathbb{P}_{X=1}(Y = 1) \\ &= (1 - p)\epsilon + p(1 - \epsilon) \\ &= -2p\epsilon + p + \epsilon\end{aligned}$$

Then we can say that Y is a Bernoulli distribution in sample space $\Omega = \{0, 1\}$ with parameter

$$\begin{aligned}q &= \mathbb{P}(Y = 1) \\ &= -2p\epsilon + p + \epsilon\end{aligned}$$

Answer

See above.

Part 2: Determine q .

Solution

With the explanation and formula above, easy to see that

$$q = -2p\epsilon + p + \epsilon = 0.86$$

Answer

$q = 0.86$

Part 3: Compute the joint probability distribution function of (X, Y) .

Solution

Easy to compute the joint distribution function of (X, Y) as

$$f(x, y) = \begin{cases} \mathbb{P}(X = 0, Y = 0) = \mathbb{P}(X = 0)\mathbb{P}_{X=0}(Y = 0) = (1 - p)1 - \epsilon = 0.095, & x = 0, \quad y = 0 \\ \mathbb{P}(X = 0, Y = 1) = \mathbb{P}(X = 0)\mathbb{P}_{X=0}(Y = 1) = (1 - p)\epsilon = 0.005, & x = 0, \quad y = 1 \\ \mathbb{P}(X = 1, Y = 0) = \mathbb{P}(X = 1)\mathbb{P}_{X=1}(Y = 0) = p\epsilon = 0.045, & x = 1, \quad y = 0 \\ \mathbb{P}(X = 1, Y = 1) = \mathbb{P}(X = 1)\mathbb{P}_{X=1}(Y = 1) = p(1 - \epsilon) = 0.855, & x = 1, \quad y = 1 \end{cases}$$

Answer

See above.
